1980-2005 POPULATION PROJECTIONS ERRATA

This errata is in reference to the following document:

Department of Development, Population
Projections by Age and Sex: 1980-2005
Prepared By: Ohio Data Users Center, June 1982

In response to an internal review of the input data used in generating county population projections from 1980 to 2005, the counties of Belmont, Lawrence, and Paulding were found to warrant changes in the years 1985 through 2005.

These changes affect cohort and county totals only; state totals will remain unchanged. The corrected inserts are attached.

INTRODUCTION

These population projections for Ohio's counties for the period 1980-2005 are produced in accordance with the August, 1979 Interdepartmental Agreement Providing For Use of Common Population Projections. This agreement states that the Department of Development has sole responsibility for projections of population at State and county levels for State departments and agencies signing the agreement.

The Department of Development will not produce sub-county level projections. Those requiring township, place or smaller area detail are encouraged to contact the relevant local government agencies, who may perform these services within the context of the state and county level numbers provided herein.

These projections are "baseline" numbers; that is, the implications of various state and local development efforts are explicitly not taken into account. The difficulty of accurately gauging the impact of these efforts precludes their use in projections that must serve many purposes.

Our "baseline" assumption provides for the fertility, mortality and migration components of population change to be projected via a combination of past trends, technical demographic limits and an equilibrium assumption regarding inter state and intra state differences.

Our current plans are to evaluate the correspondence between these projections and the annual state and county level intercensal estimates published by the U.S. Bureau of the Census. Pending the results of this continuing

evaluation we will issue updated projections in 1984.

OVERVIEW OF THE METHODOLOGY

The population projections for the State of Ohio are presented by age and sex quinquennially from 1980-2005. A cohort-component method was used which separately projects fertility, mortality, and migration by sex and age groups. Computations are carried out individually to reflect variations in birth, death, and migration rates for each cohort. Prison populations, military personnel and non resident college students are projected separately.

BASE YEAR COMPONENT DATA:

1. FERTILITY

Age-specific fertility rates for each county are determined for each five-year age group between 15-49. Fertility rates are derived from 1979-1980 births by age of mother and her county of residence. The fertility data is used to tabulate the average annual crude birth rates and the general fertility rates.

2. MORTALITY

National life tables are utilized in determining current survival rates for each cohort. Survival rates are assumed not to vary across counties.

3. MIGRATION

Net migration figures are determined by subtracting an expected population from the actual (census) population. Using the mortality data the number of

survivors from each cohort enumerated during the 1970 Census was estimated. Those born between 1970-1980 were "survived" in the same manner. After the number of expected survivors are determined these figures are subtracted from the 1980 Census figures. Differences between the two reflect either a net in-migration or out-migration.

PROJECTION ASSUMPTIONS:

1. FERTILITY

Total births for each five-year period are based on recent Ohio trends as well as projected national trends. Ohio's total fertility rate has paralleled national trends over the last two decades. Our assumption is that Ohio, like the nation, will experience a gradual increase in fertility rates over the projected period for the ages 20-44. Only the youngest childbearing age group, 15-19, is expected to show a decline in fertility rate.

Ohio's age specific fertility rates are projected to converge to national projections by the year 2005. County rates are projected to follow the state's gradation. As a result, fertility rates at the county level are individualized but follow the same state and national pattern.

2. MORTALITY

Projections of five-year survival rates by age and sex are based on national mortality assumptions. National survival rate projections completed by the Bureau of the Census indicate a gradual trend towards increased survival rates at all ages to the year 2005. Unlike fertility and migration rates, survival rates, were assumed to be identical for each county and varied only by

age and sex.

3. MIGRATION

Assumptions concerning future Ohio migration trends for 1980 to 2005 were based on a combination of 1970-1980 migration data, earlier state trends, and the expectation of a convergence to zero net migration in the future. Ohio has experienced substantial out-migration over the last two decades. The large absolute numbers of outmigrants, particularly in selected age categories, increase the probability of a decrease in future migration . Our assumption is that in the first projected five-year period, 1980-85, Ohio's migration will duplicate the previous five-years (one half the 1970-1980 net migration). Each county is assumed to experience a gradual reduction in net migration until a net migration of zero is attained in 2005. Net migration for each age group is proportionally adjusted to reflect a change in each counties migration.

A more detailed statement of the procedures employed in these projections is available upon request for the cost of reproduction. A series of reports covering the implications of these projections will be issued during the next six months.

If different presentation formats, summaries, or statistical indicators are required please contact ODUC at (614) 466-7772.
